

Annual Treatment Plan

How to use the Varroa-Controller?

When is the Varroa Controller treatment performed?

What is the effect of a treatment with the Varroa Controller?

7-10 colonies can be treated per device and application at the same time.

Why do I treat my bees with the Varroa Controller?

Spring Reduction of the mite population

Spring treatment

- Mites and their offspring are eliminated in the first 2–3 sealed brood frames through heat treatment.
- **7 to 10 colonies can be treated at once per device and application.**

- As soon as the first 2–3 frames are capped.

- **Elimination of 80%** of the reproducing mites **during the spring treatment.**

Video about the Varroa Controller

- Keep the number of mites as low as possible at the start of the brood season. If the first sealed brood frames are treated, the foundation of the problem is eliminated.
- 1 untreated mite at the beginning of the season results in 32 additional mites after 5 months (end of the season).

Summer Capturing and removing mites

Summer treatment with the Duplex-Framebox

- By confining the queen to 2 brood frames in the Duplex-Framebox, **all mites in the hive** are forced to enter and be sealed there. These mites, along with their offspring, can then be **specifically captured** and **removed** after 24 days in the sealed frames **and eliminated through heat treatment.**
- **10 colonies can be treated at once per device and application.**

- Summer solstice or earlier, depending on the nectar flow.

- Once the frames are sealed, **all mites** and **their potential offspring are concentrated in one place** and can be easily removed and eliminated with heat treatment.

Video how to use the Duplex-Framebox

Simple
+
ingenious

- Capture, remove, and treat mites in the Duplex-Framebox.
- Form new colonies with the treated frames.
- No mite pressure during the summer months.
- **20% more honey yield.**
- Essential foundation for the successful rearing of winter bees.

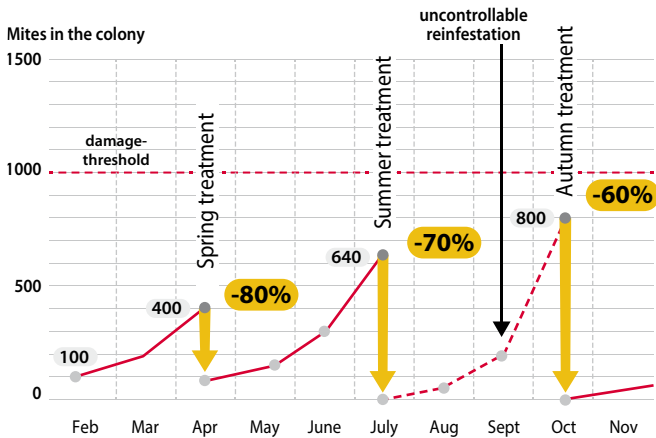

Autumn Build up a strong bee population

Autumn treatment

- Mites and their offspring are eliminated in sealed brood frames through heat treatment, similar to the spring procedure. Additionally, a final mite treatment can be combined.
- **7 to 10 colonies can be treated at once per device and application.**

- Mid-September to around mid-October.

- Get the colony free of mites and strengthen the bees for overwintering.

- Prepare colonies as best as possible for overwintering.
- Be able to respond to possible reinfestations at any time.
